Implementation of walnut pest management practices was based in Tulare, Kings, and Fresno Counties. The principle subjects were codling moth, aphids, mites, and the disease deep bark canker. An indoor intensive training session was held in Tulare County in March, 1981, to introduce growers and PCA's to management principles and techniques (a similar session was held in Stanislaus County). Pest populations and weather data were monitored in four orchards. A weekly letter was distributed to the 119 participants that provided information on day degree accumulations, trap counts, aphid and mite populations and other items of interest. Response to a questionnaire suggests that the program was well received but participants wanted more training. Alterations in approach for the coming year will include these improvements.
